# Compound Annual Growth Rate

- Compound Annual Growth Rate. The year over year growth rate applied to an investment or other part of a company's activities over a multiple-year period. The formula for calculating CAGR is  $(\text{Current Value}/\text{Base Value})^{(1/\# \text{ of years})} - 1$ .

# CAGR

- Investopedia explains 'Compound Annual Growth Rate - CAGR'
- CAGR isn't the actual return in reality. It's an imaginary number that describes the rate at which an investment would have grown if it grew at a steady rate. You can think of CAGR as a way to smooth out the returns.

Don't worry if this concept is still fuzzy to you - CAGR is one of those terms best defined by example. Suppose you invested \$10,000 in a portfolio on Jan 1, 2005. Let's say by Jan 1, 2006, your portfolio had grown to \$13,000, then \$14,000 by 2007, and finally ended up at \$19,500 by 2008.

Your CAGR would be the ratio of your ending value to beginning value ( $\$19,500 / \$10,000 = 1.95$ ) raised to the power of 1/3 (since 1/# of years = 1/3), then subtracting 1 from the resulting number:

1.95 raised to 1/3 power = 1.2493. (This could be written as  $1.95^{0.3333}$ ).

$$1.2493 - 1 = 0.2493$$

Another way of writing 0.2493 is 24.93%.

Thus, your CAGR for your three-year investment is equal to 24.93%, representing the smoothed annualized gain you earned over your investment time horizon.

# Definition of CAGR

- Definition of 'Compound Annual Growth Rate - CAGR'
- The year-over-year growth rate of an investment over a specified period of time.

The compound annual growth rate is calculated by taking the nth root of the total percentage growth rate, where n is the number of years in the period being considered.

This can be written as follows:

$$\text{CAGR} = \left( \frac{\text{Ending Value}}{\text{Beginning Value}} \right)^{\left( \frac{1}{\# \text{ of years}} \right)} - 1$$

# Durchschnittliche Wachstumsrate

- Die Abkürzung **CAGR** steht für Compound Annual Growth Rate und beschreibt die durchschnittliche jährliche Wachstumsrate. Die CAGR errechnet sich durch Division des aktuellen Wertes durch den Ausgangswert. Von dem Ergebnis wird die n-te Wurzel gezogen, wobei n die Anzahl der Jahre sind, die betrachtet werden. Dieses Ergebnis wird um Eins subtrahiert, um das jährliche Wachstum bzw. einen Wert für das CAGR zu erhalten.
- Beispiel:  
Ein Unternehmen erzielt in 2005 einen Umsatz von 1.000.000 € und in 2009 einen von 2.000.000 €. Um das durchschnittliche jährliche Umsatzwachstum zu berechnen, kann die CAGR herangezogen werden. Demnach muss die 4. Wurzel (=2009-2005) aus 2 (=2.000.000 €/1.000.000 €) gezogen werden, was gerundet einer CAGR=1,19 entspricht. Damit beträgt das durchschnittliche jährliche Wachstum 19%.
